

Pettibon

Doctor Pettibon, on the right, is a modern teacher, inventor, and researcher in chiropractic techniques and procedures. I like the fact he isn't afraid to tell you the technique works or it doesn't.

The Pettibon System is an advanced scientific approach to chiropractic that many patients have not experienced; it focuses on spine and posture correction.

I have a deep respect for any technique or procedure that can show a measured correction on x-ray.

In 1998, I spent six months taking x-rays before and after two weeks of treatment on my patients to see if his procedures worked. I saw a measurable reduction of their problem in all the patients. I also found the closer one duplicated his work, the better the results. I also found the patients that dropped out of my care for six months or more were still improving.

The Pettibon Precision Cervical Adjusting Instrument is an adjusting instrument based on the research and studies of Dr. Burl Pettibon in the sixties.

X-rays are taken; exact vectors are measured and utilised to set the instrument to deliver an exact and precise thrust without human error.

I use this adjusting instrument when someone seems to get worse after a regular chiropractic treatment on the neck. It will help the hard to fix problems.

Modern Pettibon techniques are based on correcting posture and maintaining correct posture. The Pettibon Procedures include mobilisation by hand and with one or more mechanical adjusting instruments for precise application of correcting forces.

The secret to the success of the Pettibon procedures is found under Pettibon Protocols at our Clinic.
